## Laertiadae Classis

## ODYSSEUS Introduction

The goal of mankind is to become a multiplanet species, otherwise the alternative is to remain on Earth forever and head straight for an eventual extinction event.

## But why do we choose

 Mars?- We took in consideration all the planets of our Solar System, with a particular attention to the 3 rocky planets: Mercury, Venus and Mars. After several analysis we found that Mars is the best planet that human kind can colonize

Mars is the best planet that mankind can colonize.

# Mars/Earth Comparison 

## Table

|  | Mars | Earth |
| :---: | :---: | :---: |
| Atmosphere (composition) | Carbon dioxide (95,32\%) <br> Nitrogen ( $2,7 \%$ ) <br> Argon (1,6\%) <br> Oxygen (0,13\%) <br> Water vapor (0,03\%) <br> Nitric oxide (0,01\%) | ```Nitrogen (77\%) \\ Oxygen (21\%) \\ Argon (1\%) \\ Carbon dioxide (0,038\%)``` |
| Atmosphere (pressure) | 7,5 millibars (average) | 1013 millibars (at sea level) |
| Equatorial Radius | 3397 kilometers | 6378 kilometers |
| Gravity | 0,375 that of Earth | 2,66 times that of Mars |
| Length of Day | 24 hours, 37 minutes | 24 hours |
| Length ofYear | 687 Earth days | 365 days |
| Surface Temperature | $-63^{\circ} \mathrm{C}$ | $14^{\circ} \mathrm{C}$ |
| Tilt of Axis | $25^{\circ}$ | $23,45^{\circ}$ |

## Landing Zone Selection

The best sites: $\quad-25^{\circ}<$ Latitude $<25^{\circ}$
Water >5\%

## Landing Zone Selection

- The finalist sites:

| Site | Latitude | Water <br> Availability | Geological <br> interest | Biological <br> interest | Final <br> mark |
| :---: | :---: | :---: | :---: | :---: | :---: |
| Gale <br> Crater | $-5.4^{\circ}$ | $\approx 7 \%$ | $9 / 10$ | $8 / 10$ | 8 |
| Gusev <br> Crater | $-14.5^{\circ}$ | $\approx 10 \%$ | $8 / 10$ | $10 / 10$ | 9 |
| Planum <br> Meridians | $\approx 0^{\circ}$ | $\approx 5 \%$ | $7 / 10$ | $6 / 10$ | 7 |

Planum
Meridiano
S

Gale
Crater Gusev Crater

## Gusev Crater

Gusev Crater is an crater which took shape during the first half of Noachian period, when Mars was still damp and with a thick atmosphere.

- The water collected inside the crater, forming a lake, withfa possible hydrothermal activity on the bottom.

## Gusev Crater

## Why do we use the

$3+\frac{1}{2}$

The Interplanetary Transport System (ITS), also known as the Mars Colonial Transporter (MCT), is the name of a project funded by the private company "SpaceX".

## Why do we use the ITS

- The ITS is projected for a possible human settlement on Mars and it includes reusable launch vehicles and spacecraft. Its technology can also support some eventual exploration missions to other locations of our Solar System.

| Length | $49,5 \mathrm{~m}$ |
| :--- | :--- |
| Max Diameter | $17,0 \mathrm{~m}$ |
| Propellant Mass | Ship: <br> Tanker: 2500 t |
| Dry Mass | Ship: 150 t <br> Tanker: 90 t |
| Cargo to Mars | 450 t (with transfer on orbit) |

## Why do we use the ITS

1. It comes from a private agency, so everybody can use it (international);
2. It is reusable, so it is not that expensive;
3. It can carry an heavy payload to Mars;
4. It is possible to modify the inner part.

## Mission One - Profile

- Phase o: ResourceDragon

## Mars E.D.L.

## ResurceDragon

Water Extractor

## Resources production

- Water extraction:
-"Salt extraction":

Another method is to capture the Martian humidity via salts by the atmosphere.

heat
-Soil mining:

The soil is composed of a $10 \%$ ice; heating soil is possible to let ice evaporate and separate Water.

## Resources production

## Resources production

## - Oxygen Production:

- A part of Oxygen can be generated from Martian CO2 through this reaction:

- That is catalyzed by a series of Electroceramics, which detach an atom of Oxygen using electric current. The excess CO is expelled to the outside atmosphere.

## Resources production

- Fuel (Methane/ Oxygen) production:
- The procedure to produce fuel is very long, so the cargo section should arrive on Mars more than a 6 year before the crew.
$4 \mathrm{H}_{2} \mathrm{O} \rightarrow 2 \mathrm{O}_{2}+4 \mathrm{H}_{2}$ electrolysis

Sabatier reaction $4 \mathrm{H}_{2}+\mathrm{CO}_{2} \rightarrow 2 \mathrm{H}_{2} \mathrm{O}+4 \mathrm{CH}_{4}$

# Some Numbers 

1 Kg of regolith

$89 \mathrm{~g} \mathrm{of} \mathrm{CH}_{4}$

66 g of O 2.

- We need $\mathbf{5 0 0}$ ton of $\mathrm{CH}_{4}$ : it's necessary to work 4508 ton of regolith. With this process we will produce also 297 ton of $\mathbf{O 2}$.
- The 'ResourceDragons' will work on Mars for 1450 days (4 years). It means that they will produce 3 ton of regolith each day.

The oven will have to heat about $0,09 \mathrm{~m}^{\mathbf{3}}$ of regolith in a hour.

## Mission One - Profile

## - Phase I: Cargo and Base

Mars
E.D.L. lay down orbital refueling

304 days trip

5X

recycling

launch

The most delicate maneuver is the one that allows to position the ITS/Base horizontally after landing.

Landing position

## Base Planimetry

## Base Planimetry

VR room

## Mission One - Profile

- Phase II: Crew round trip

Mars
E.D.L.

## Crew launch

## Mission One

- Crew: 6 People (3 man and 3 women);
- Stay on Mars: 40 Days;
- Crew Launch: 6 February 2031
- Targets: -Install a first human outpost on Mars;
-Search traces of Life;
-Study the past of the Gusev Crater;

## The crew

> 2 aerospace engineers;
$>1$ medical doctor (who has some knowledge in biology);
$>1$ biologist (who has some knowledge in medicine);
$>1$ geologist (who has some knowledge in astrophysics);
$>1$ astrophysicist (who has some knowledge in geology).

# Weightlessness Solutior 

- The Skin-Suit

It is a particular suit which provides 'loading' in the head-to-foot direction, for recreating the load of gravity on Earth, but in weightlessness.

## Surface Operation

- The crew will have a rover with which will realize 3 trips, each towards a Region Of Interest (ROI):

| Site | Distance | Travel Time | Coordinates |
| :---: | :---: | :---: | :---: |
| Landing Site | o Km | o hours | $\begin{gathered} 14^{\circ} 47^{\prime} 25^{\prime \prime} \mathrm{S} \\ 175^{\circ} 51^{\prime} 54^{\prime \prime} \mathrm{E} \end{gathered}$ |
| $\frac{\text { Columbia }}{\text { Hills }(A)}$ | 22 Km | 1 hours | $\begin{aligned} & 14^{\circ} 35^{\prime} \mathrm{S} \\ & 175^{\circ} 31^{\prime} \mathrm{E} \end{aligned}$ |
| Pingo (B) | 33 Km | 1.65 hours | $\begin{aligned} & 14^{\circ} 14^{\prime} \mathrm{S} \\ & 175^{\circ} 57^{\prime} \mathrm{E} \end{aligned}$ |
| $\frac{\text { Ma'adim }}{\text { delta (C) }}$ | 40 Km | 2 hours | $\begin{aligned} & 15^{\circ} 20^{\prime} \mathrm{S} \\ & 175^{\circ} 31^{\prime} \mathrm{E} \end{aligned}$ |

The travel times are based on the maximum speed of the rover $20 \mathrm{~km} / \mathrm{h}$

## Surface Operation

## Weather

## Seismic survey

- A method $\sqrt{\text { Thanks to this technique it is possible to analyze }}$ the subsoil placing some seismometers and blowing up small charges on the surface.

## Mission Profile One

## Farming

## Astronaut Diet

- With the greenhouse extension during the second mission, the cultivable space will be increased to $470 \mathrm{~m}^{\mathbf{2}}$; this space will be cultivated with a lot of new plant species, which will enrich the astronauts diet. The greenhouse will make the base totally independent from Earth.

## Astronaut Diet

| Food | Carbs | Fats | Proteins | Sugars | Energy (Kcal) <br> for $\mathbf{1 0 0} \mathbf{g}$ |
| :---: | :---: | :---: | :---: | :---: | :---: |
